No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```
This is the envelope protein (Env) of a new human endogenous retrovirus (HERV), designated IDDMK1.2-22, that has been identified as the source of superantigen (SAg) activity in insulin-dependent diabetes mellitus (IDDM) patients. The endogenous retrovirus is ubiquitous in the human genome but is only expressed in diabetic individuals. The HERV encodes SAg activity within the env gene. A claimed process for the diagnosis, including the pre-symptomatic diagnosis, of a human autoimmune disease associated with a HERV having SAg activity comprises specifically detecting in a biological sample either: (a) the mRNA of an expressed HERV having SAg activity (especially IDDMK1.2-22 5'LTR, 3' long terminal crepeat, env or pol); (b) a protein or peptide expressed by the HERV (see AAM97745-48); (c) antibodies specifically associated with the CHERV. products of the invention can be used to identify substances capable of blocking transcription or translation of SAg-encoding nuclear acid sequences, useful in therapy and/or prevention of human proteonical acid sequences useful in therapy and/or prevention of human proteonical acid sequences useful in the source of the force of the human crises associated with the SAg. A nucleic acid encoding the protein of the source of the force of the f
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            auroimmune disease associated with the SAq. A nucleic acid encoding human retroviral SAq can be used as a DNA vaccine. Expression of the endogenous SAq in IDDM suggests a general model according to which self SAq-driven and systemic activation of autoreactive T

                                                                                                           The present invention relates to human single exon nucleic acid probes (SENP: see AAI10068-AAI28459). The present sequence is a peptide encoded by one such probe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably
                                                                                                                                                                                                                                                                         cervical cancer. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Peptide #1365 encoded by probe for measuring placental gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    455
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                515
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            240

                                                                                                    The present invention relates to single exon nucleic acid probes (SENP: see AAI31315-AAI57546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of

(see AA10010-AA110067). The present sequence is a peptide encoded by one such probe. The probes are useful for measuring human gene expression in a human breast sample, where the probe hybridises at high stringency to a nucleic acid expressed in the human breast. The probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human breast, particularly those diseases with polygenic aeticlogy. The diseases include breast cancer, disorders of development, inflammatory diseases of the breast, fibrocystic changes, proliferative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               printed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              breast disease and non-carcinoma tumours.
Note: The sequence data for this patent did not form part of the printed
specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                /el single exon nucleic acid probe used to measuring gene expression a human breast {\boldsymbol{\cdot}}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  STRLWNSQSSIDQKLASQINDLRQTVIWMGDRL-DLEHHFQLQCDWNTSDFCITPQIYNE 455

                                                                                                                                                                                                                                                                                                                                                                              The sequence is that of an insulin-dependent diabetes mellitus associated human endogenous retrovirus (IDDMK1.2-22) env protein. The retrovirus has Superantique (SAg) activity. It can be used as part of a method is specifically used to diagnose type I diabetes mellitus. Modified proteins expressed by the retroviral sequence (without SAg activity but still able to induce an immune response) are useful in vaccines to treat or prevent SAg-related autoimmune disease; nucleic acid sequences encoding (modified) SAg are important in pathogenesis of autoimmune disease, probably by activating to treat such disease, probably by activating autoractive T cells. The method is very specific (it can differentiate between expressed and non-expressed viral nucleic acids) and can be used even where the pathogen is an ubiquitous endogenous retrovirus. Blood cor plasma samples can be tested without extensive preparation and diagnosis can be made before clinical signs are apparent, allowing early intervention before severe tissue damage has occurred.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ;

This is the envelope protein (Env) of a new human endogenous retrovirus (HERV), designated IDDMK1.2-22, that has been identified as the source of superantigen (SAB) activity in insulin-dependent diabetes mellitus (IDDM) patients. The endogenous retrovirus is ubiquitous in the human genome but is only expressed in diabetic individuals. The HERV encodes SAB activity within the env gene. A claimed process for the diagnosis, including the pre-symptomatic diagnosis, of a human autoimmune disease associated with a HERV captivity (especially including the pre-symptomatic having SAB activity (especially IDDMK1.2-22 5'LTR, 3' long terminal repeat. env or pol); (b) a protein or peptide expressed HERV see AMB/7745-446); (c) antibodies specifically associated with the HERV. Products of the invention can be used to identify substances capable of blocking transcription or translation of SAP encoding nucleic acid sequences, useful in therapy and/or prevention of autoimmune disease associated with the SAB. A nucleic acid encoding the endogenous SAB in IDDM suggests a general model according to which self SAB-driven and systemic activation of autoreactive T

The sequence is that of all insulin depondent disperse mentious secondated human endogenous retrovirus (IDDMK1.2-22) env/fs protein. The retrovirus has Superantigen (SAg) activity. It can be used as part of a method is specifically used to diagnose type I diabetes mellitus. Modified proteins expressed by the retroviral sequence (without SAg activity but still able to induce an immune response) are useful in vaccines to treat or prevent SAg-related autoimmune classas; nucleic acid sequences encoding (modified) SAg can be used similarly to treat such diseases. Retroviral-encoded SAg are important in pathogenesis of autoimmune disease, probably by activating cutoreactive T cells. The method is very specific (it can differentiate between expressed and non-expressed viral nucleic acids) and can be used even where the pathogen is an ubiquitous endogenous retrovirus. Blood corp plasma samples can be tested without extensive preparation and diagnosis can be made before clinical signs are apparent, allowing carly intervention before severe tissue damage has occurred.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Diagnosing human autoimmune disease by detecting retrovirus with superantigen activity - new retrovirus associated with type 1 diabetes, its proviral DNA, and related vectors, transformed cells, proteins, antibodies and specific binding agents, used for treating or preventing autoimmune disease
                                                                                                                                                                                            IDDM; insulin-dependent diabetes mellítus; endogenous retrovirus;

AAW97747 RESULT

Human endogenous retrovirus IDDKK1.2-22 Env/F-S (SAg).

(first entry)

21-MAY-1999

AAW97747;

```
This is the envelope (Env)/FS polypeptide of a new human endogenous retrovirus (HERV), designated IDDMK1.2-22, that has been identified as the source of Superantigen (SAG) activity in insulin-dependent diabetes mellitus (IDDM) patients. The endogenous retrovirus is ubiquitous in the human genome but is only expressed in diabetic individuals. The HERV encodes SAG activity within the env gene.

A claimed process for the diagnosis, including the pre-symptomatic diagnosis, of a human autoimmune disease associated with a HERV capagnosis, of a human autoimmune disease associated with a HERV having SAG activity (especially IDDMK1.2-22 5'LTR, 3' long terminal biological sample either: (a) the mRNA of an expressed HEV having SAG activity (especially IDDMK1.2-22 5'LTR, 3' long terminal repeat, env or pol); (b) a protein or peptide expressed by the HERV (see AAW97745-48); (c) antibodies specific to the proteins expressed by the HERV. Products of the invention can be used to identify substances capable of blocking transcription or translation of SAG-encoding nucleic acid sequences, useful in therapy and/or prevention of autoimmune disease associated with the SAG. A nucleic acid encoding the endogenous SAG in IDDM suggests a general model according to which self SAG-driven and systemic activation of autoreactive T
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated human endogenous retrovirus - used to develop products for the diagnosis, prevention and treatment of autoimmune disease, particularly insulin dependent diabetes mellitus
                                                                                                         HERV; IDDKKI.2-22; superantigen; SAg; antigen; IDDM; insulin-dependent diabetes mellitus; autoimmune disease; diagnosis; therapy; vaccine; envelope protein; env gene.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes primer sets for synthesising 5602 full-length CDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises a 3'-end sequence, where the oligonucleotide comprises a 3'-end sequence, where the oligonucleotide comprises at least 15 nucleotides and the combination of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       the 5'-end sequence'3'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynuclectides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention provides a method for inducing an immune response to mouse mammary tumor virus (MMTV) in a human subject. The method comprises administering to the subject an immunomodulatory composition comprising a
the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH33166 to AAH13628 and AAH13631 to AAH13642 represent human cDNA sequences; AAB92466 to AAH3639 represent human amino acid sequences; and AAH13629 to AAH33632 represent oligonucleotides, all of which are used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 pharmaceutical carrier and at least one MMTV antigen (or a discontinuous epitope of MMTV) in an amount sufficient to elicit an increase in a MMTV specific cellular or humoral response. The compositions and methods of the invention are useful for treating or preventing a human disease or discorder caused by MMTV, or a biological or chemical agent that reacts with an antibody directed towards an MMTV antigen. The compositions and antibodies may be used in passive immunotherapy. The immunomodulatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               compositions can be used in a preventative manner for those subjects not

The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               JSRV causes epithelial carcinoma in ovine animals, partic. pulmonary adenomatosa in sheep. The complete cDNA sequence of the JSRV genome was prepared from an approx. B.7kb band of poly-A RNA isolated from seemi-purified lung lavage samples from infected sheep. The invention includes the Env amino acid sequence or any part of it which is capable of specific immunological reaction with antibodies directed against JSRV. The glycoproteins gp46 or gp31 and the precursor PR69 env are preferred. See also AAR31346-R31348 and AAQ35153-Q35155.

ö
polynucleotide which comprises a 3'-end sequence, where the oligonucleotide comprises at least 15 nucleotides and the combination of the 5'-end sequence/3'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs as as a second of the full-length AAH13632 to AAH13638 and AAH13633 to AAHH3642 represent human cDNA sequences; ABB92446 to AAH13632 represent human amino acid sequences; and AAH13632 to AAH13632 represent oligonucleotides, all of which are used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          462 MVRRHLQGREDNLTLDISKLKEQIFEASKAHLNLVPGTEAIAGVADGLANLNPVTWIKTI 521

```

sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises a 3'-end sequence, where the oligonucleotide comprises at least 15 nucleotides and the combination of the 5'-end sequence/3'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs. The primers allow obtaining of the full-length AAH13613 to AAH13612 represent human anino acid sequences; AAH36446 to AAH13612 represent human anino acid sequences; and AAH13629 to AAH13612 represent coligonucleotides, all of which are used in the exemplification

the present invention.

276 AA;
